

	Grau en ENGINYERIA INFORMÀTICA	
	Course: Projecte Web	
	PROFESSORS: Roberto Garcia i David Sarrat	
	CURS: 2025/26	Deliverable 1

Basic web application.

From the proposed scenario, if professors' feedback hasn't been negative: develop, using Django, a basic web application for data access (access the data following the proposed scenario). The application must:

1. Implement, **correctly**, the proposed model.
2. Activate the Django admin interface to add, modify and delete instances.
3. Add user authentication and registration.
4. Include the required files to run the application as a docker container orchestration using docker-compose.
5. Adhere, as much as possible, to the 12factor guidelines.
6. (Recommended) Include at least one or more web pages (views/templates) that already display and allow browsing the application data (e.g., list/detail pages, basic navigation...) or a homepage.
7. (Recommended) Provide a clean and usable user interface design. Visual consistency, layout, and overall presentation will be valued positively.

Grading

To pass the assignment (up to 6 points) you must resolve points: 1, 2, 3 and 4, with a data model of at least 3 different related entities in a complex relationship.

You should properly document the proposed solution, that includes: a revised data model documentation, with the implemented model (satisfying professors' feedback).

If the proposed solution is correctly done: up to +3 points.

If the implementation follows the 12factor guidelines, and is well implemented/designed up to +1 points.

Work delivery

Code should be available in a github.com (or gitlab.com or any other site) repository created for this purpose.

That repository has to be used with a different username for each participant members.

The git repository should be publicly accessible.

The delivered work should include detailed instructions on how to run/deploy the application.

Documentation to deliver

A text (.txt, .md, .pdf) stating:

1. Github public address.
2. That notes that developers consider should be done concerning all design decisions.
3. If the grades shouldn't be equals between all members of the team, how those grades should be divided. Such file should be also added to the git repository.

All members of the group will have to use the virtual campus to upload their work.
